

Abdul Wahid

EC-Council CND (Certified Network Defender)

Incident Response & Forensics Investigation – AlienVault OSSIM Ticketing & Windows Live Forensics

Executive Summary

When an incident hits, every second counts — and every ticket must tell the truth.

Module 16 puts you in the defender's chair. In a focused VMware lab (192.168.100.0/24), three machines power two critical skills: structured incident handling and live Windows forensics.

First, AlienVault OSSIM becomes your incident command center. Students log in, navigate the ticket queue, manually create high-priority Alarm tickets, enrich them with source and destination IPs, and filter by class and type — mastering the exact workflow used in real SOCs to track and escalate threats.

Then the investigation goes deeper. Live-Forensicator is deployed on the Windows system, executed, and its comprehensive report is opened and dissected. Key artifacts — process lists, network connections, user activity, and forensic traces — are examined to reconstruct what actually happened on the machine.

Result: complete hands-on mastery of incident ticket lifecycle management in a SIEM and rapid live forensic analysis — the two pillars that turn detection into decisive response.

Virtual Machine & Network Setup

#	VM Name	Used in Lab(s)	IP Address
1	**Web Server**	Lab 1	192.168.100.130
2	**OSSIM Server**	Lab 1	192.168.100.75
3	**Admin Machine-1**	Lab 1 + Lab 2	192.168.100.138

Gateway: 192.168.100.2

There are 2 labs in Module 16 (Incident Response and Forensics Investigation).

1. **Lab 1 –** Working with Incident Tickets in OSSIM
2. **Lab 2 –** Forensic Analysis of Windows System using Live-Forensicator

Working with Incident Tickets in OSSIM

Learn how to create, view, edit, filter, and manage incident tickets in AlienVault OSSIM (Open-Source Security Information Management) for proper incident tracking and workflow management.

Objective

Launch and access OSSIM Server

Login to OSSIM web interface

View existing tickets

Manually create a new incident ticket

Edit ticket details (Source/Destination IP)

Filter tickets by Class and Type

Machines Required

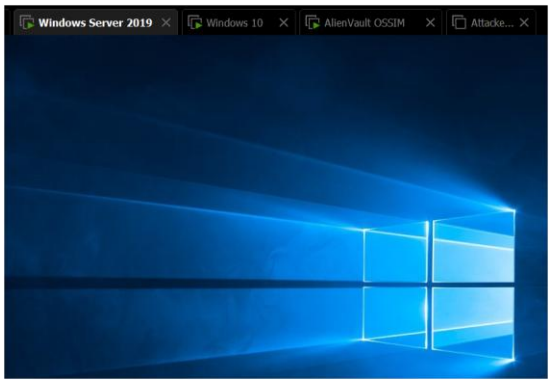

Machine	IP (from lab)	Role
Web Server	192.168.100.130	Supporting machine
OSSIM Server	192.168.100.75	AlienVault OSSIM SIEM
Admin Machine-1	192.168.100.138	Used to access OSSIM web UI

Tools Required

Tool	Purpose
AlienVault OSSIM	SIEM platform for ticket management
Google Chrome	Access OSSIM web interface

Launch Required Machines

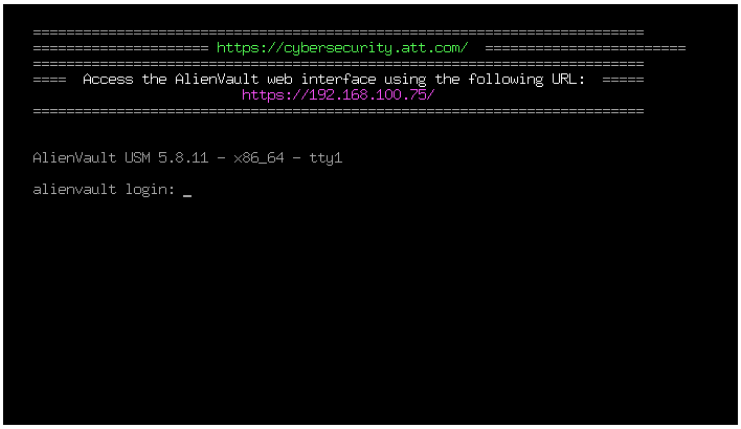

Launch Web Server VM.

Launch OSSIM Server VM.

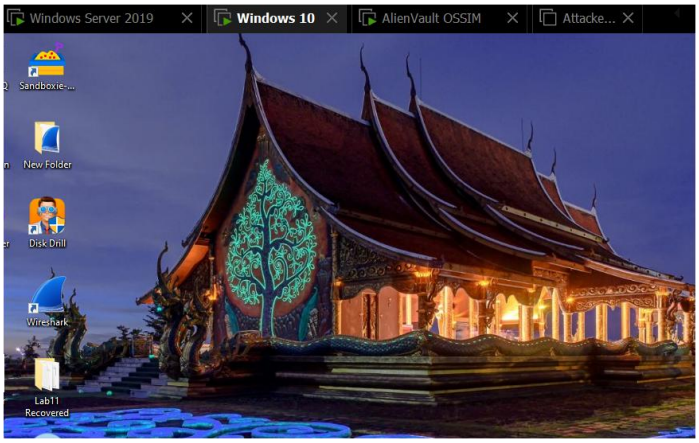

Login with username **root** and password **root**.

Wait until the AlienVault Setup screen appears (green background).

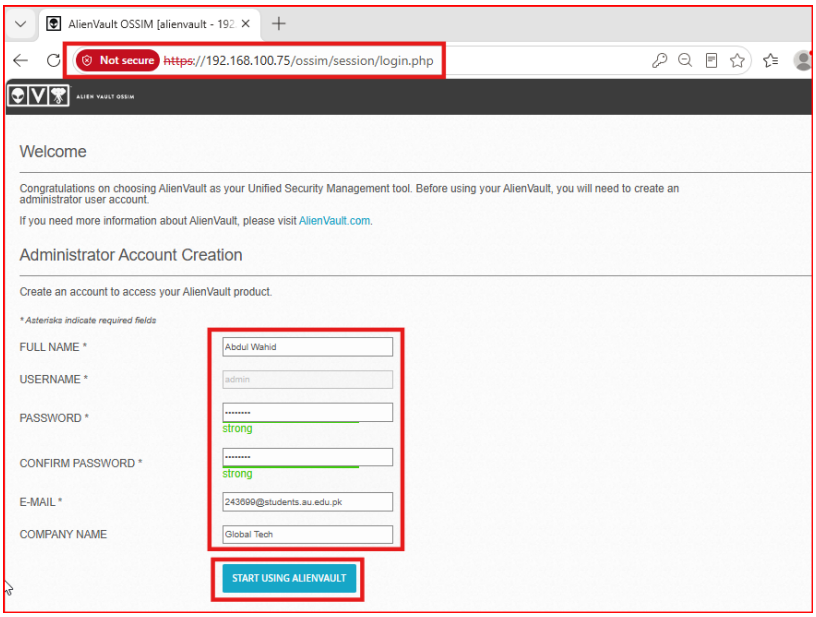

Launch Admin Machine-1 VM.

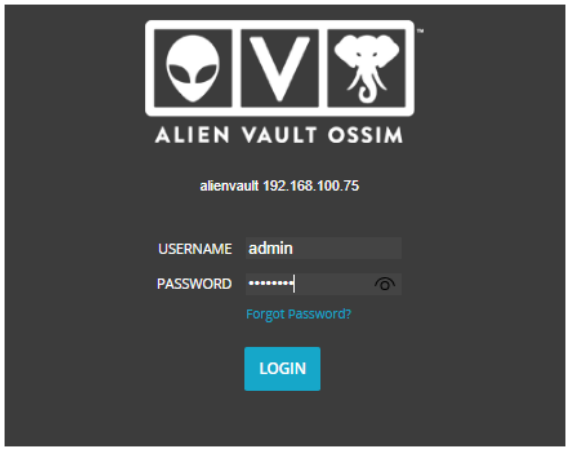

Access OSSIM Web Interface

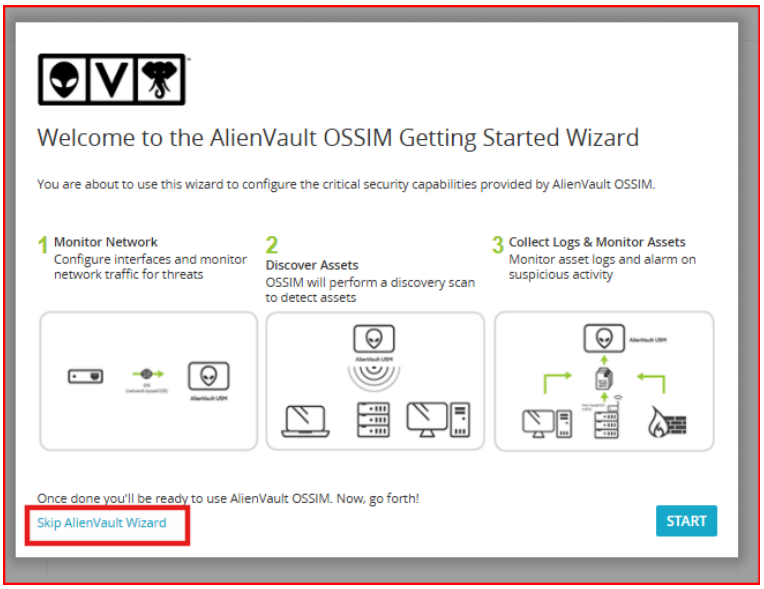

1. On Admin Machine-1, open **Google Chrome**.
2. Type https://192.168.100.75 in the address bar and press Enter.
3. Click **Advanced → Proceed to 192.168.100.75 (unsafe)**.
4. Login page appears.
    - Username: **admin**
    - Password: **Admin123**
5. Click **Start Using AlienVault**.

6. Enter Username & Password -> admin & Admin123
7. Click LOGIN.

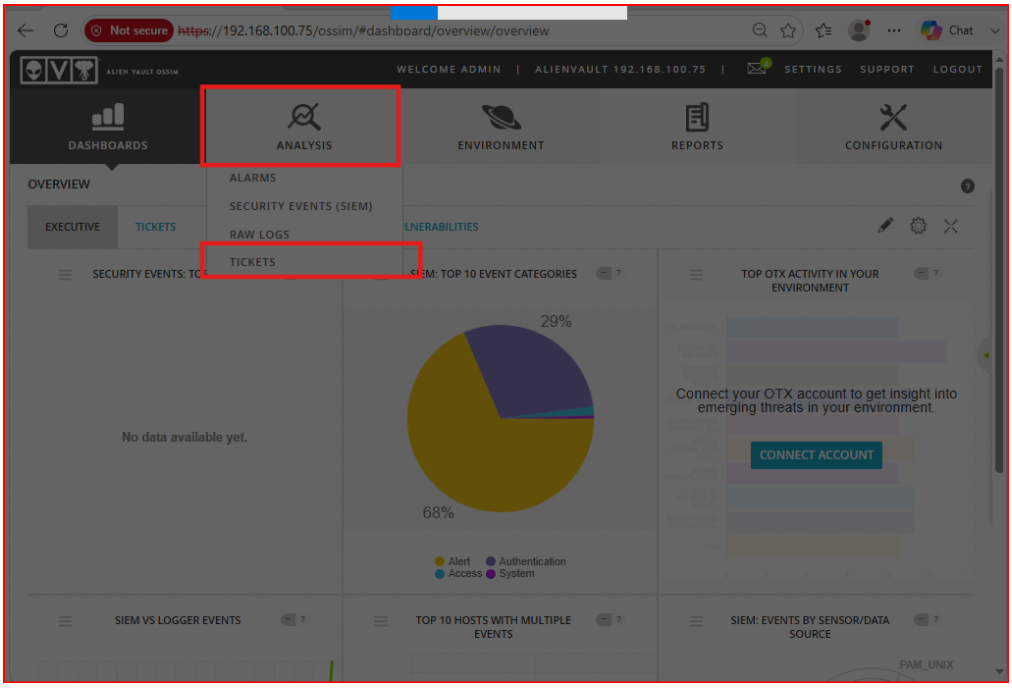

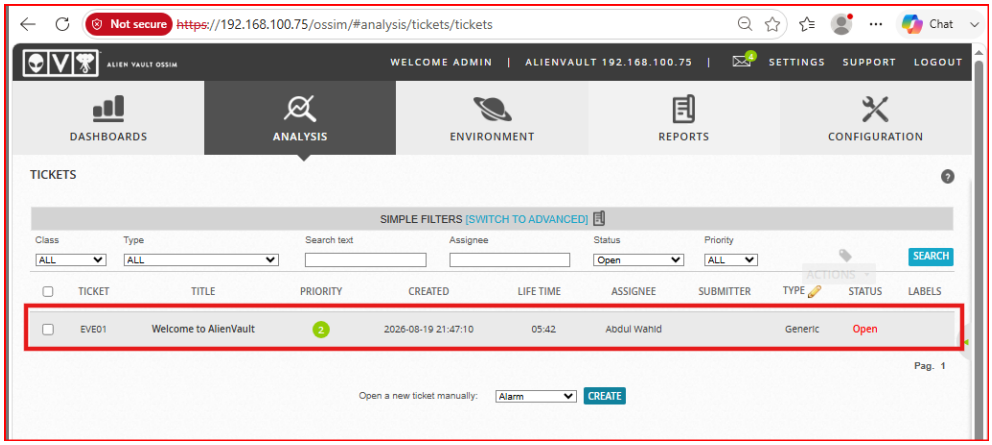

8. Click **Skip AlienVault Wizard**.
9. If the "Help Us Improve AlienVault OSSIM" popup appears → click **CANCEL**.

Navigate Tickets

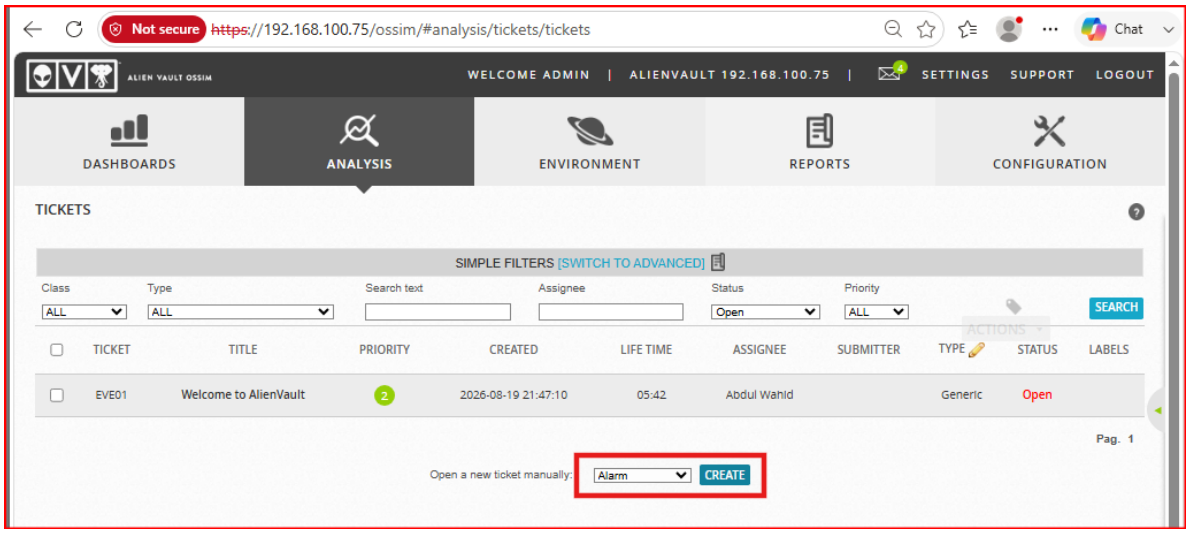

1. Hover the mouse on **ANALYSIS**.
2. Click **TICKETS**.
3. You will see the list of existing tickets.

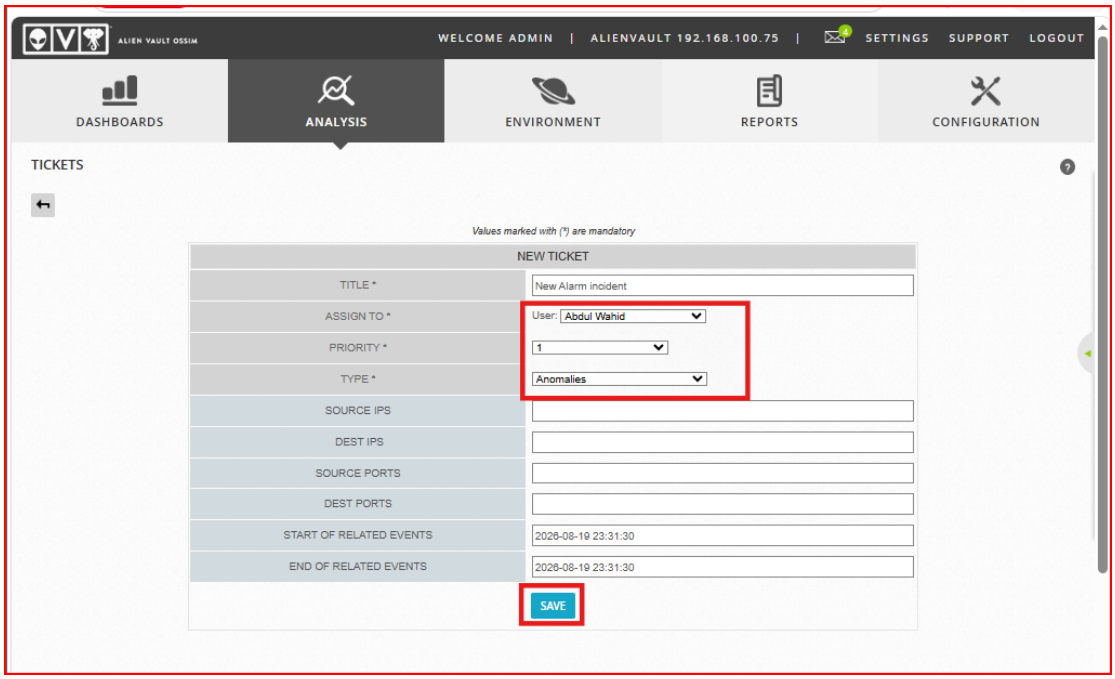

Creating a New Ticket Manually

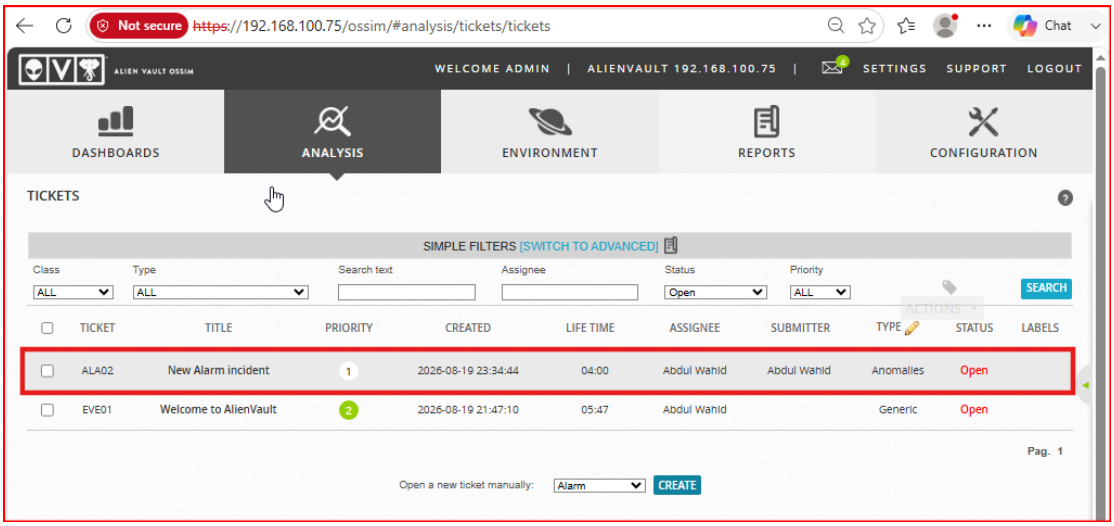

1. Scroll to the bottom of the Tickets page.
2. Under **Open a new ticket manually**, select **Alarm** from the dropdown.
3. Click **CREATE**.

4. Fill out the following details:
    - **TITLE**: New Alarm incident
    - **ASSIGN TO**: Administrator
    - **PRIORITY**: 1
    - **TYPE**: Anomalies
5. Click **SAVE**.

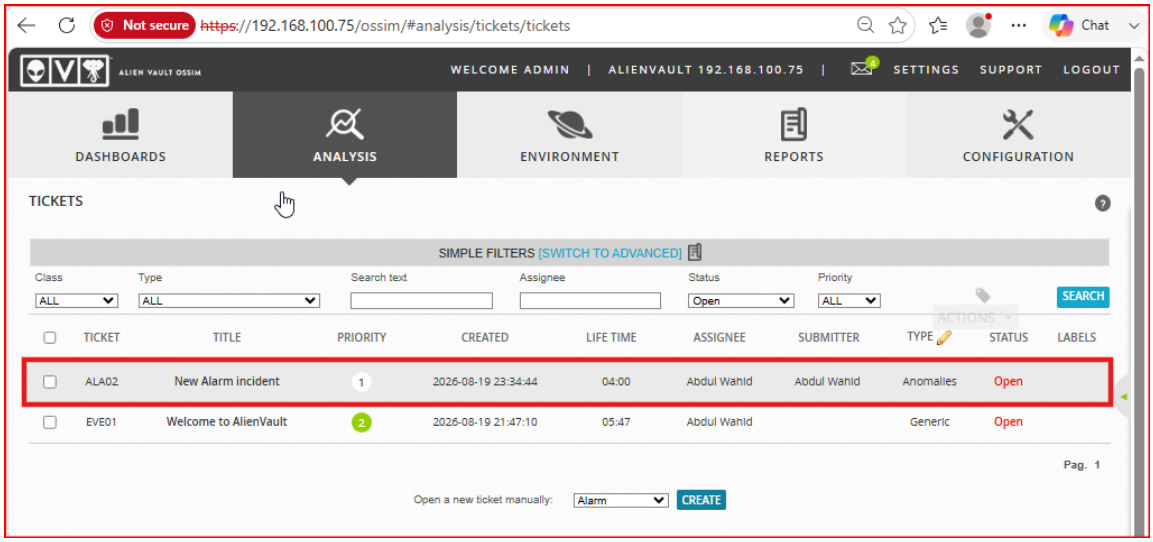

6. New tickets appear in the list (Ticket ID usually starts with ALA).

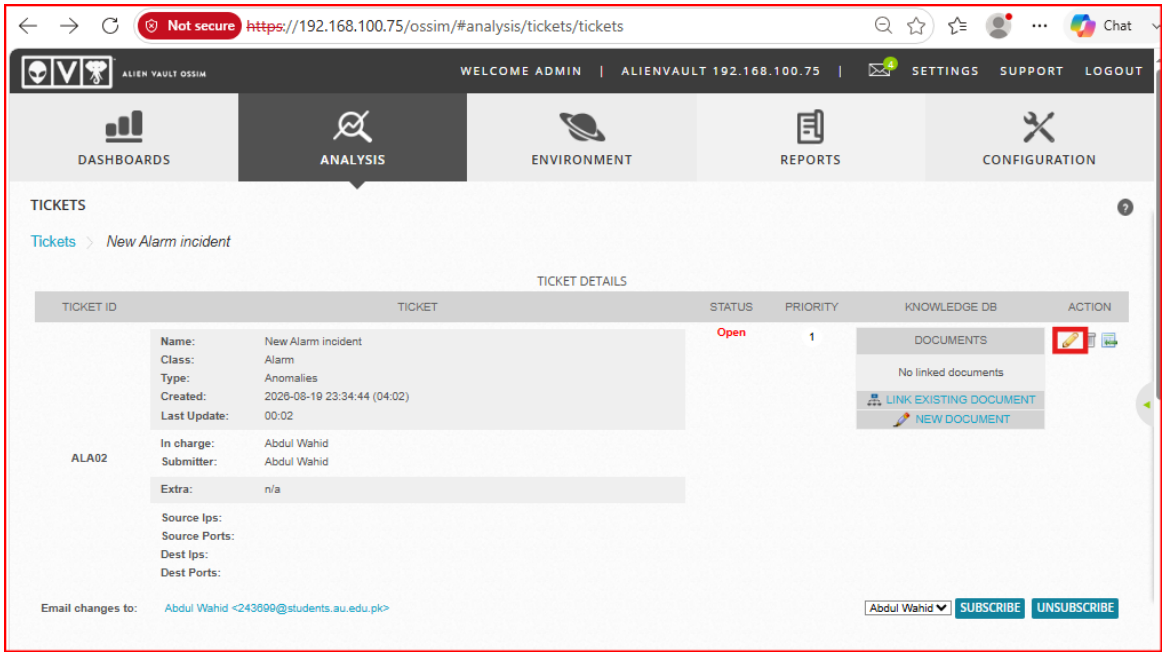

Edit Ticket Details

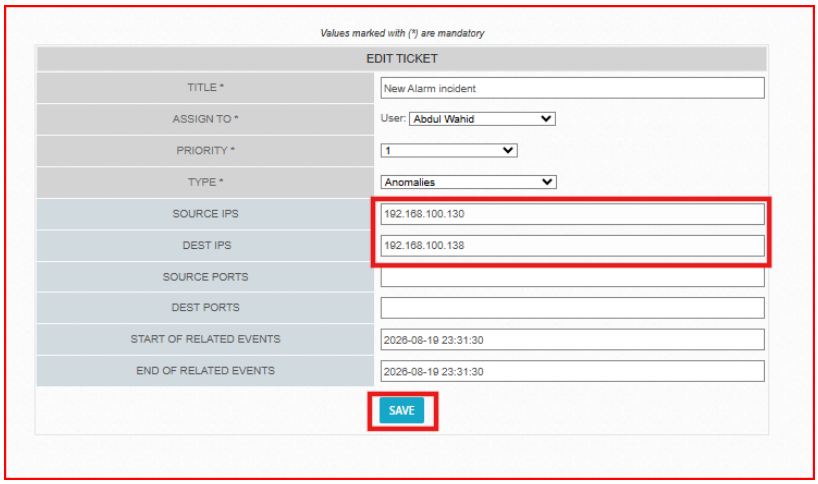

1. Click on the newly created ticket title (**New Alarm incident**).

2. On the Ticket Details page, click the **Edit Ticket** icon (pencil) under ACTION.

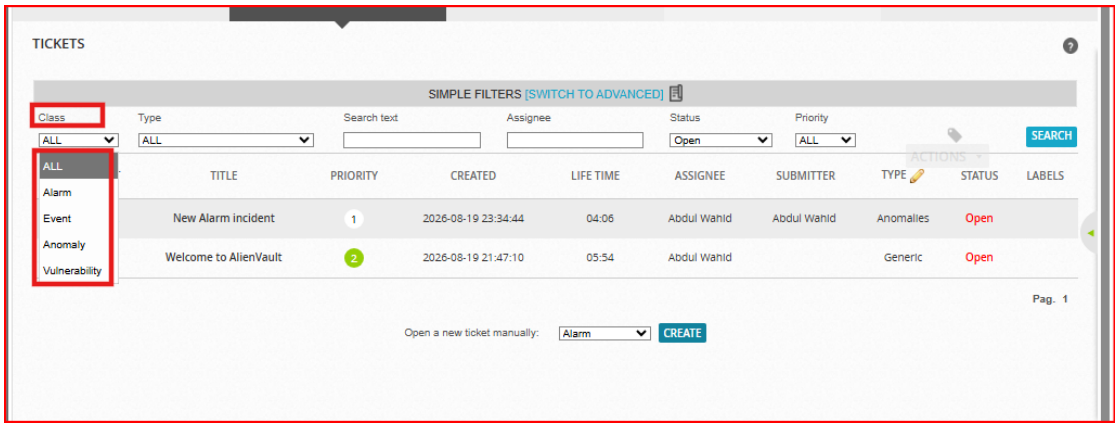

3. Enter:
    - **SOURCE IPS**: 192.168.100.130
    - **DEST IPS**192.168.100.138
4. Click **SAVE**.

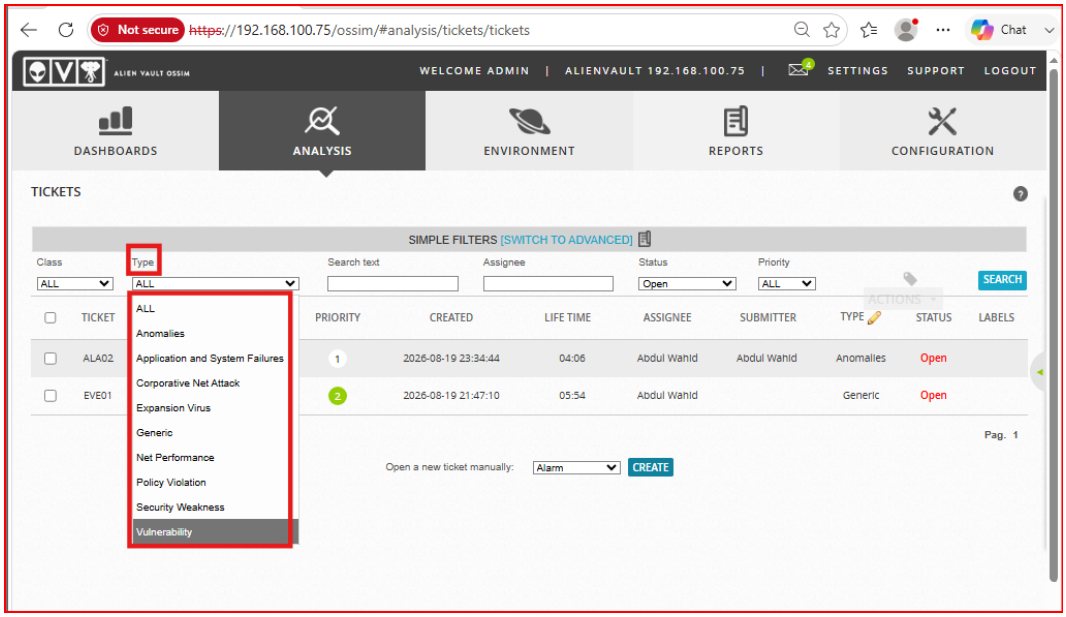

Filter Tickets

1. On the Tickets page, use the **Class** dropdown to filter (e.g., Alarm, Anomaly, Vulnerability).

2. Use the **Type** dropdown to further filter within a Class.

Successfully learned how to manage incident tickets in AlienVault OSSIM. You can now create, edit, view, and filter tickets, which is a core skill for incident response workflow and tracking security events in a SOC environment.

Forensic Analysis of Windows System using Live-Forensicator

Perform live forensic analysis on a Windows system using the open-source tool Live-Forensicator to collect and examine system artifacts, browsing history, user accounts, processes, and suspicious activities.

Objective:

Disable Windows Defender (required for tool execution)

Extract and run Live-Forensicator

Collect live forensic data

Generate and open the HTML forensic report

Analyze browsing history, user accounts, system information, and suspicious activities

---

Machines Required

Machine	Role
Admin Machine-1	Target system for live forensic analysis

Tools Required

Tool	Purpose
Live-Forensicator	Open-source live forensic collection tool
Windows PowerShell	To execute the Forensicator script
Microsoft Edge / Chrome	To view the generated HTML report

Launch Admin Machine

Turn Real-time protection to Off.

Click Yes on the UAC prompt.

Setup & Install Live-Forensicator

Live-Forensicator Download Link:

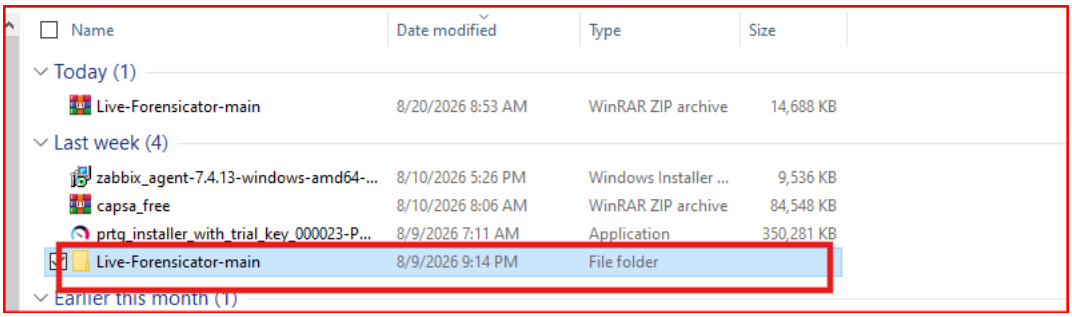

Official GitHub Repository:

https://github.com/Johnng007/Live-Forensicator

Direct Download (ZIP):

https://github.com/Johnng007/Live-Forensicator/archive/refs/heads/main.zip

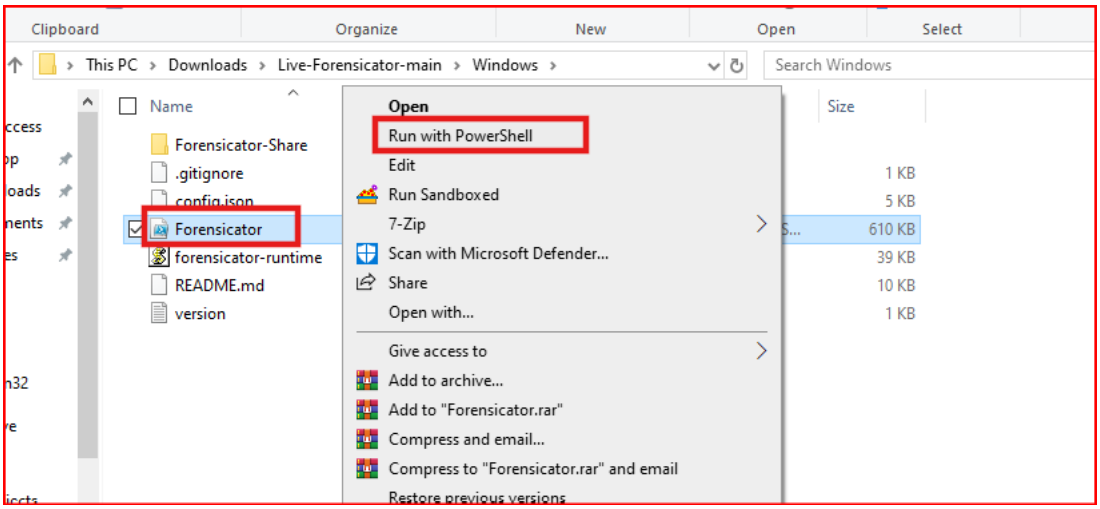

Double-click the Live-Forensicator-main RAR/ZIP file.

Run Live-Forensicator

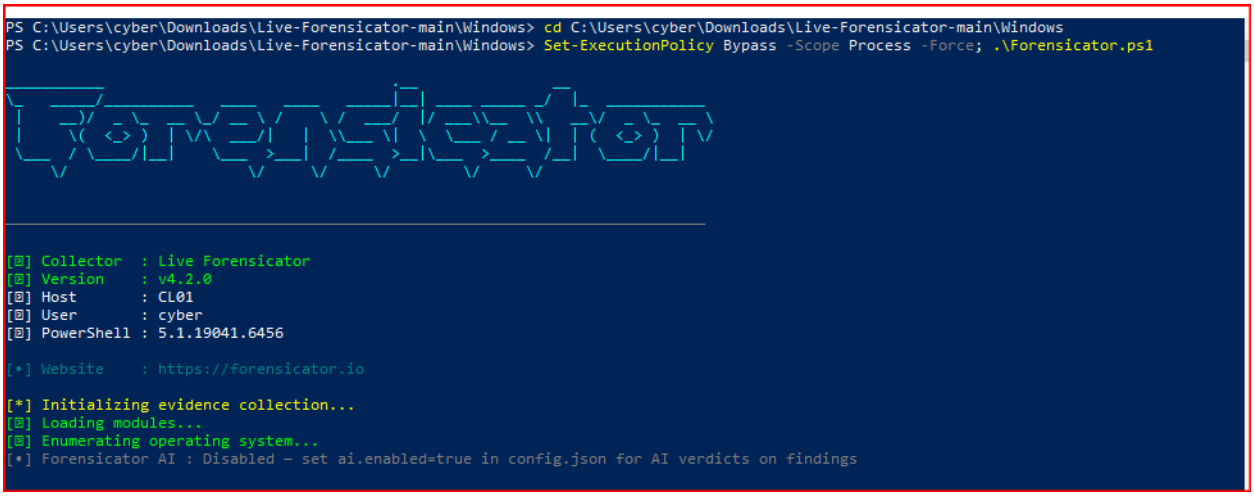

Right-click on the file **Forensicator** (PowerShell script).

Save the location

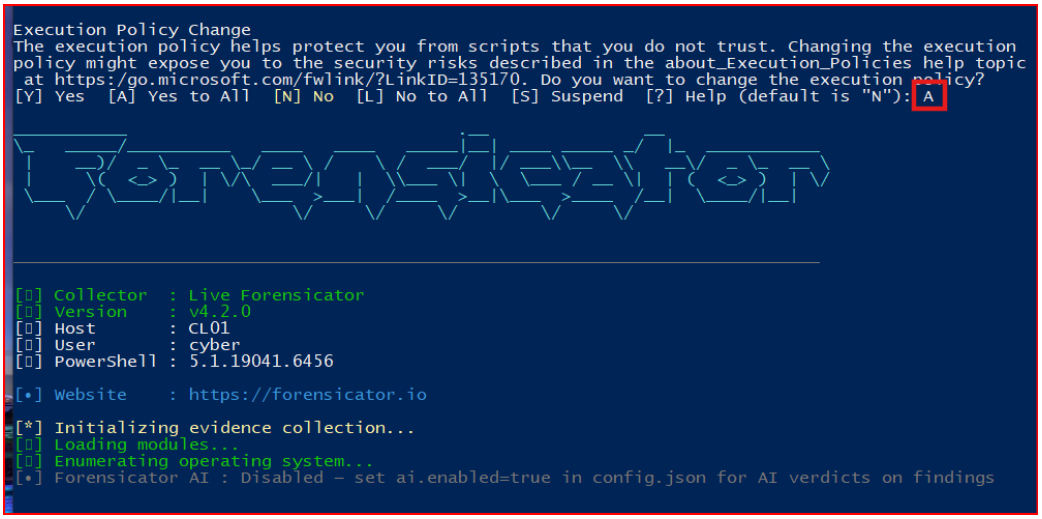

Open PowerShell as Administrator

Navigate to the directory & run the Forensicator

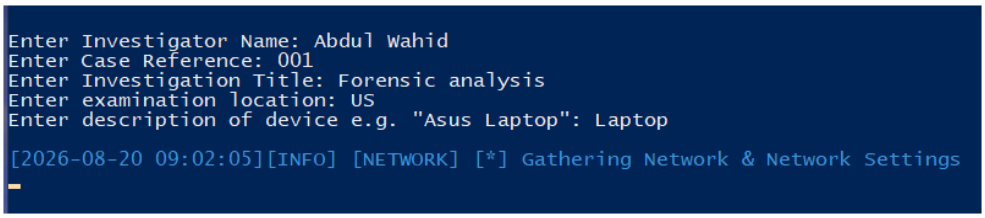

When prompted about Execution Policy → type **Y** and press Enter.

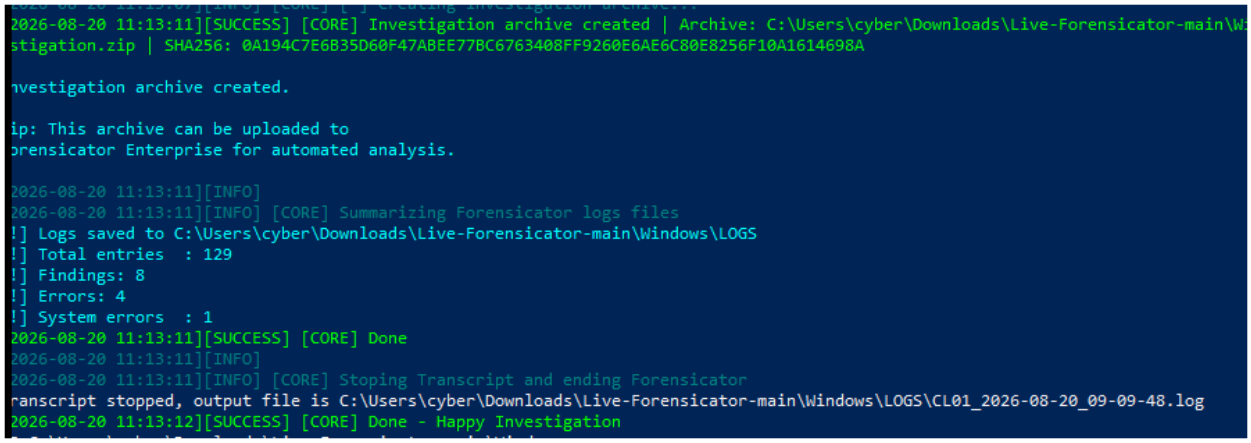

Enter the following details when asked:

- Investigator Name → **Abdul Wahid**
- Case Reference → **001**
- Investigation Title → **Forensic analysis**
- Examination location → **US**
- Description of device → **Laptop**

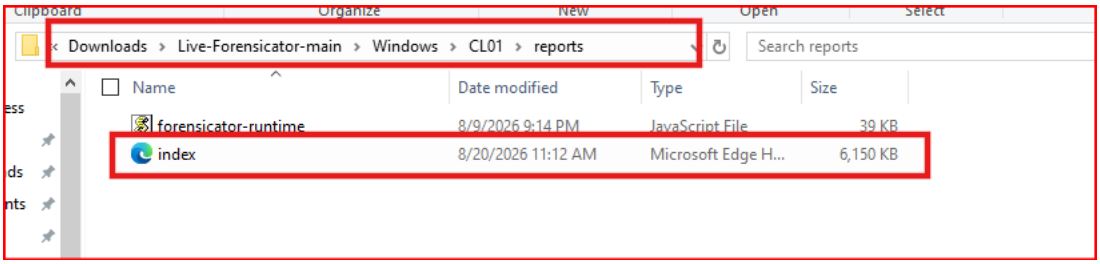

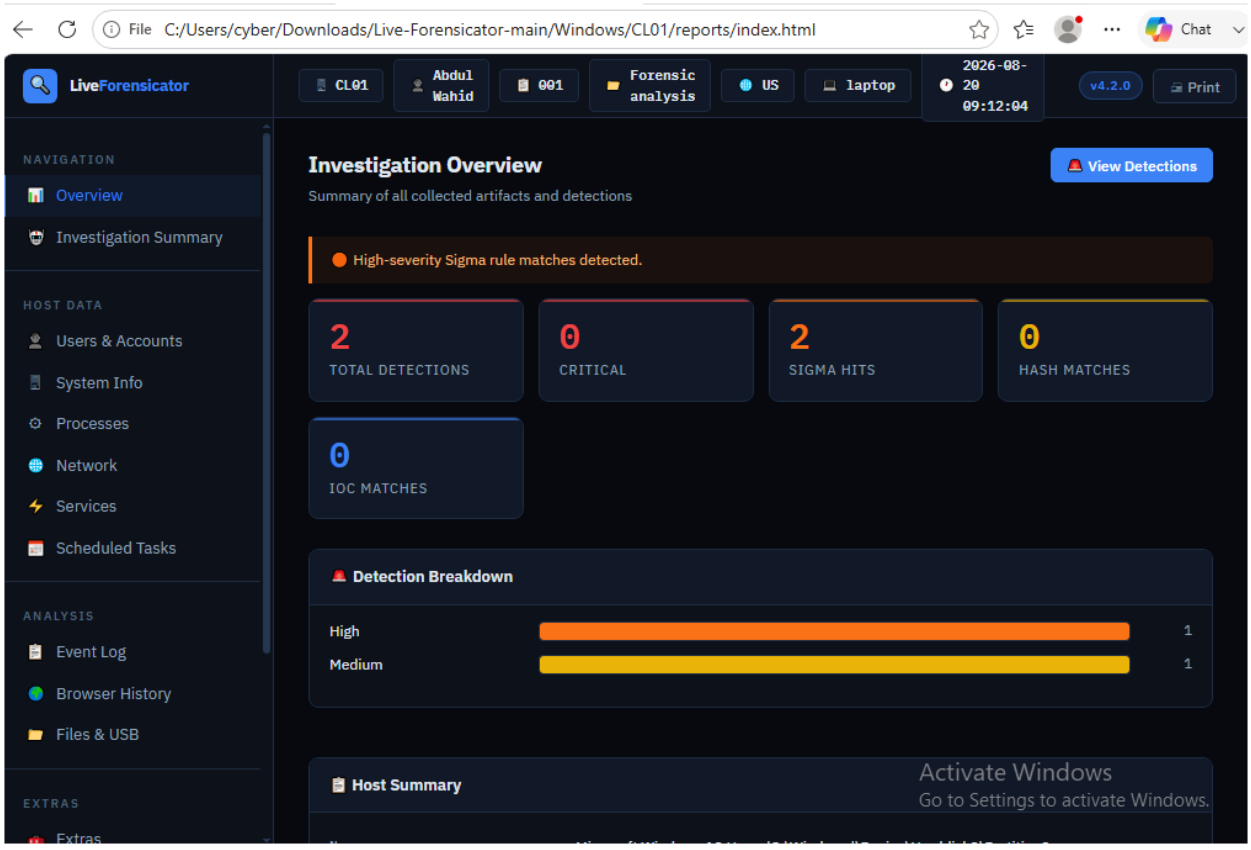

Wait for the scan to be completed (it will automatically close when finished).

Open and Analyze the Forensic Report

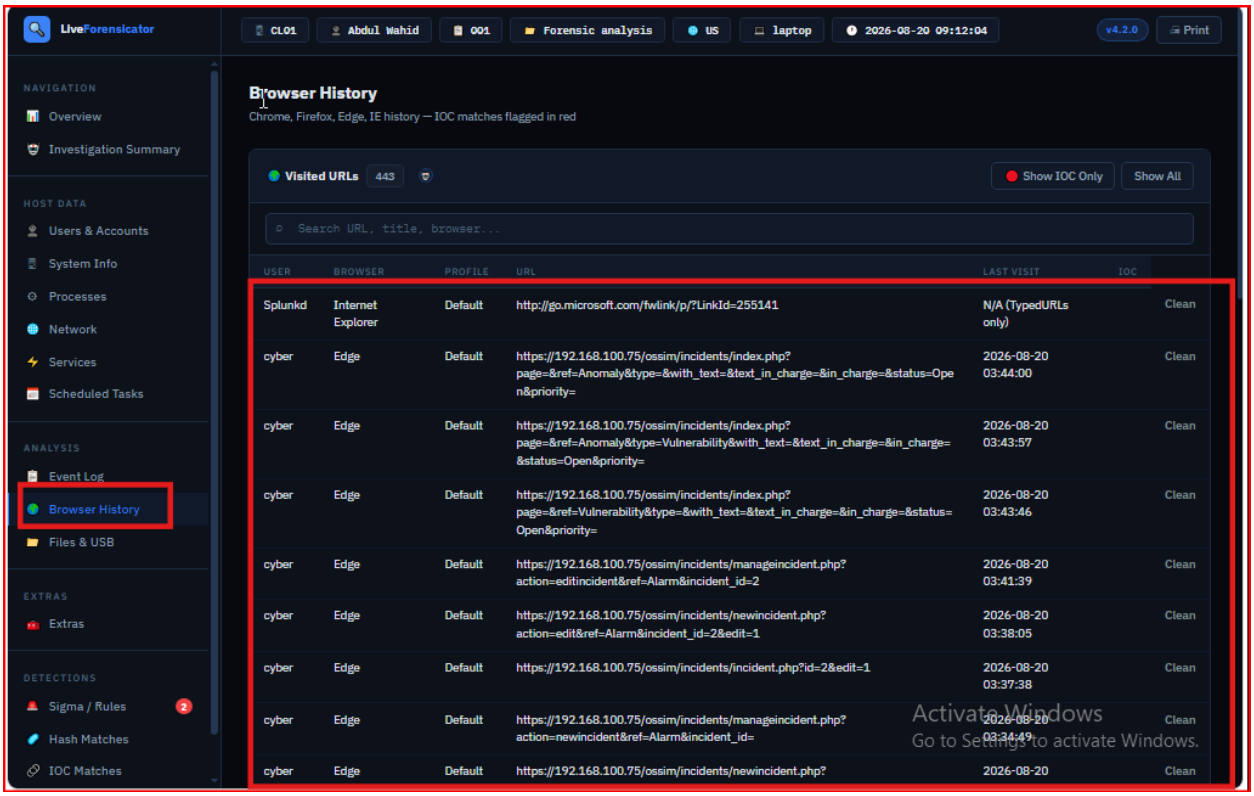

1. Go back to the **Live-Forensicator-main** folder.
2. Open the newly created folder named **ADMIN-MACHINE-1**.
3. Double-click the **index** file (HTML report).
4. The Live Forensicator report opens in the browser.

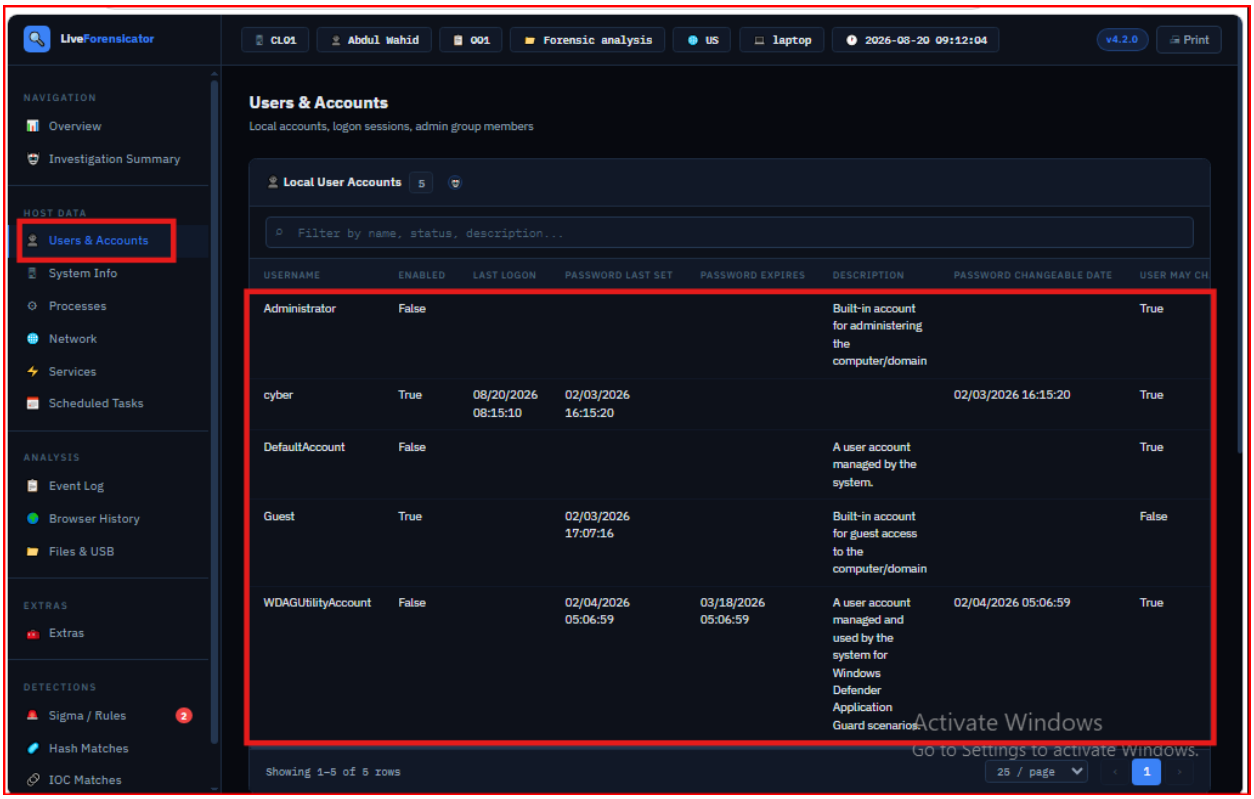

Examine Key Artifacts

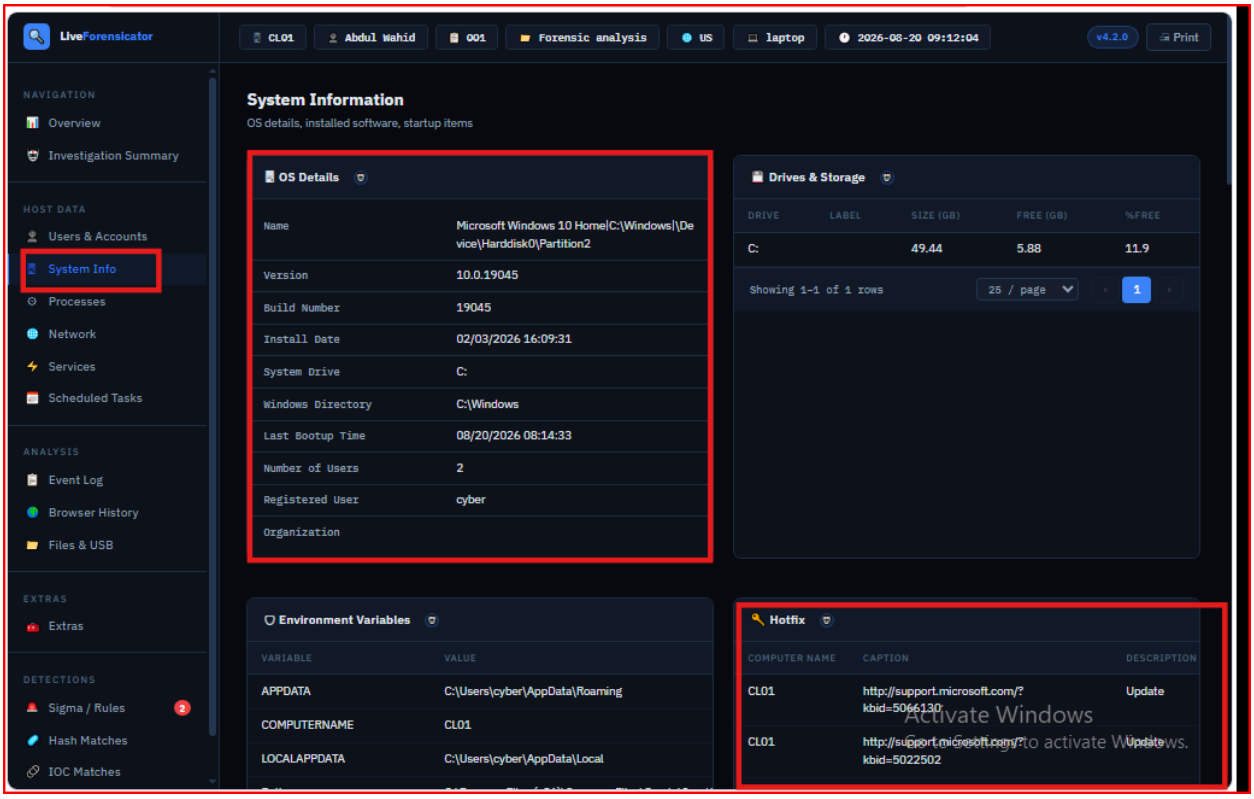

1. Click **View Browsing History** → open **Chrome_History_of_Admin.txt** and examine visited websites.

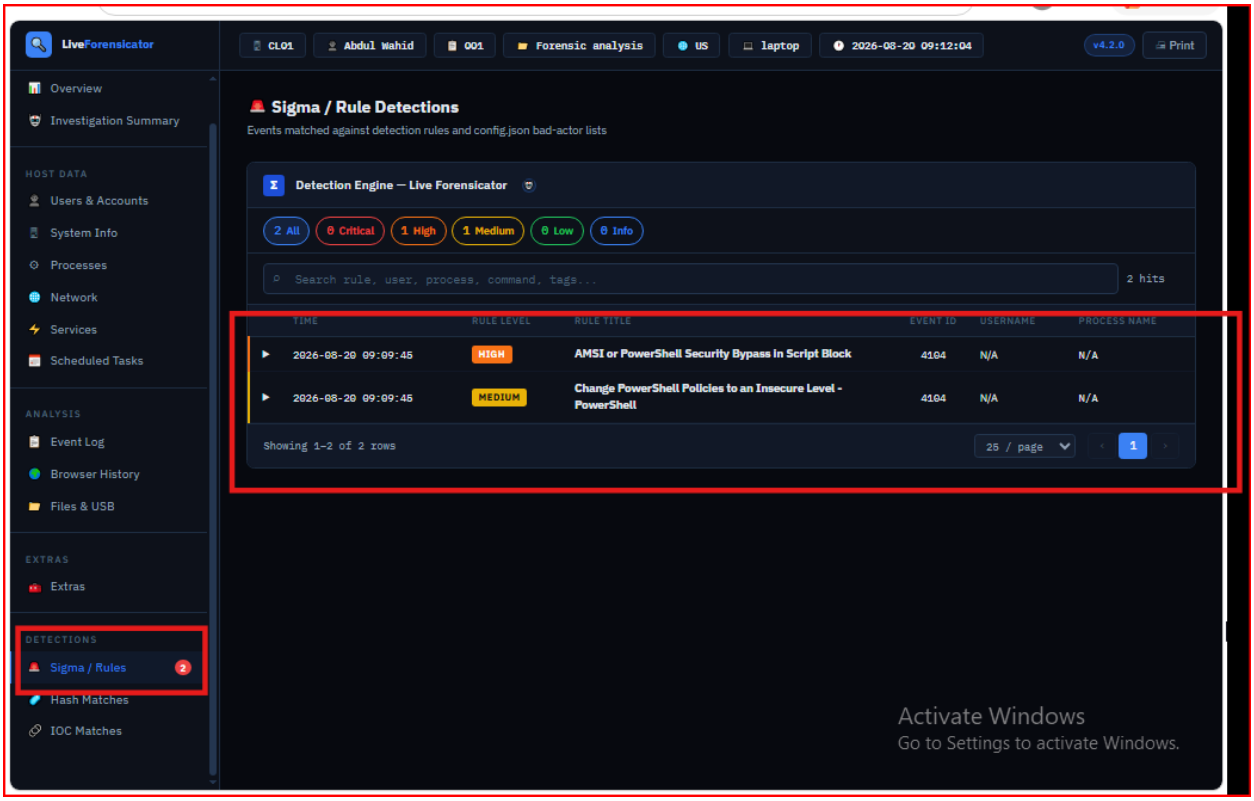

2. In the left pane, click **Users & Accounts** → expand sections to view current user, logon sessions, and administrator accounts.

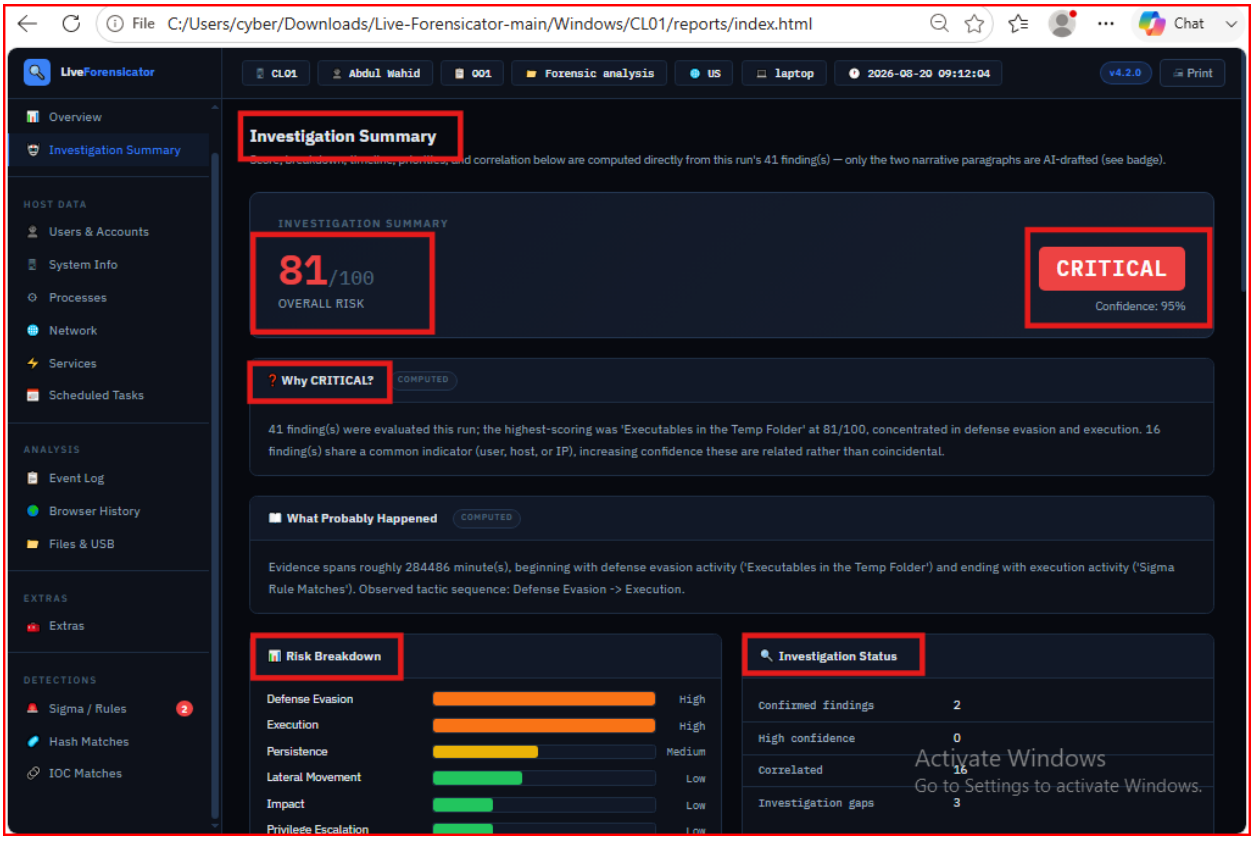

3. Click **System Information** → review installed programs and system details.

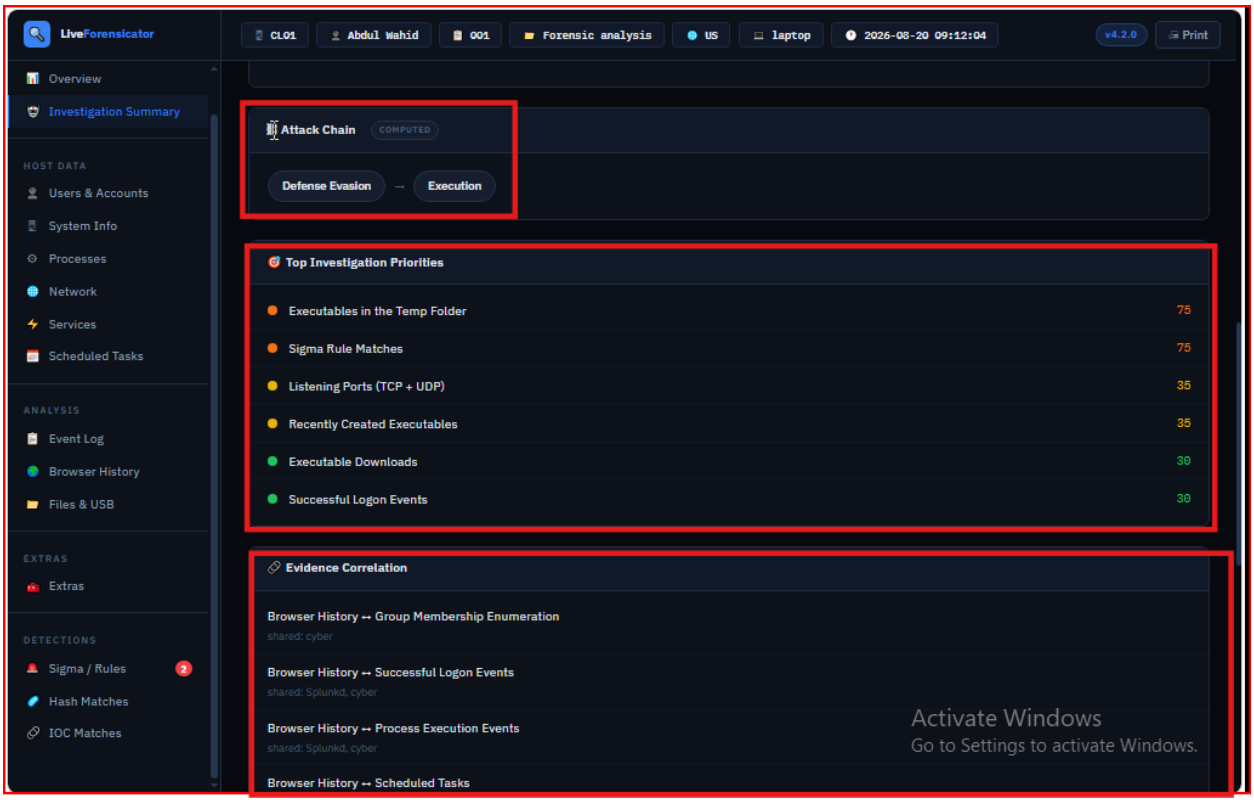

4. Click **Suspicious Activities** → check for any flagged items.

5. Explore other sections (Network Information, System Processes, Event Log Analysis, etc.) as needed.

Successfully performed live forensic analysis using Live-Forensicator. You collected critical system artifacts (browsing history, user accounts, processes, network info, etc.) without shutting down the system. This skill is essential for rapid incident response and digital evidence collection in a live Windows environment.

Conclusion

From the first OSSIM ticket to the final forensic artifact, Module 16 delivered real incident response capability.

Incident tickets were created, enriched, filtered, and managed inside AlienVault OSSIM with professional workflow discipline. Live-Forensicator then unlocked the Windows system, producing a detailed report that revealed processes, connections, and critical evidence — turning raw data into a clear investigative narrative.

The lab is complete. Tickets are under control, evidence is collected, and the path from alert to forensic truth is now second nature. Defenders are ready for the real fight.
